

SEMI AUTOMATIC HIGHLY PRODUCTIVE SOCK LABELLING MACHINE. VERY FLEXIBLE FOR FREQUENT CHANGES OF PACKAGING STYLES .

Specific developments: please contact us

Label pick up device

Option 2

Hook dispenser

Sewing automate with evacuator—stacker

MAIN SPECIFICATIONS

FLEXIBILITY

This machine fastens labels of all sizes and shapes whatever their folding type (« V » or « U ») thanks to its special sewing device for fine and thick products (Exceptionnal : up to 30 mm thickness).

Option 1: a label dispenser that places the labels in waiting pre-folding position, which enables to fold the label onto the socks while the previous pair of socks is being sewn (considerably increases productivity).

An unloading and stacking device frees the operator to enable him to prepare the next operation (on request we can offer a belt evacuation).

Option 2: a device that dispenses and applies suspension hooks onto the label.

Option 3: a device that prints and applies self-adhesive labels.

Option 4: after the evacuation / stacking a belt can be added to convey products under a paper or plastic film banding station.

SIMPLICITY

Simplicity of installation, flexibility of use, and low maintenance enable good price / performance rate.

The sewing machine is electronically-controlled regarding the number of stitches, the stitch width, the speed, the selection of removable or non-removable stitch.

This machine is perfectly adapted to frequent changes of packaging styles.

QUALITY

A special presser foot reduces marking and crushing of labels.

PRODUCTIVITY

As the products are introduced into the rider labels while sewing cycle is made the production is about **1200 pairs / hour**.

It may vary according to the operator skill, the duration of the production runs, and the type of workstation.
